

I am an architecture graduate from Virginia Tech who is seeking for a career transition to the field of web development/design. In addition to courses and lessons I took in school with my own time, I recently finished an online course at Bloc during my spare time while working at a construction company.

Having gone through a five year architecture program, my sense of design is stronger than most software engineers and many other disciplines. As an architectural designer, software like Photoshop and Illustrator are one of the most basics that we need to train ourselves in. The school of architecture at Virginia Tech does not actually have an extensive technical training catalog. Thus, we have gain the ability to learn software fast and be resourceful when we come to a technical difficulty. In addition, my strong interest in coding makes me a unique candidate that has not only the experience, but the passion in both design and development. Throughout my online program at Bloc, I have demonstrated to be an adept at HTML, CSS and JavaScript and picked up JQuery along the way. My one year experience at Teel Construction trained me to excel at self and team management. I was given my own project (Pie Five at BWI Concourse B) to build towards the end of my employment with 9 months of experience. I was able to manage the team of subcontractors on my own and complete the project on schedule. The company is known to throw people in the water and see if they can swim; although it is not my favorite thing to be tossed into water, but I managed to swim to the shore.

Please refer to my resume for a detailed information of my experience and education. Should you find interest in my application, I would very much appreciate an opportunity to meet and chat at your convenience.

Sincerely,

Hank
